Documentation

The following information sheets illustrate the description below:

- **32-Y101-4P-E**: Sectional view of the lance with main dimensions
- **32-W101-6A-E**: Sectional view of the head of the lance with atomiser
- **00-Y101-8G-E**: Diagram of pneumatic/hydraulic system inside the lance (1 solenoid)
- **00-Y101-8H-E**: Diagram of pneumatic/hydraulic system inside the lance (2 solenoids)

General

The burnerlance 32-HA-D-…-5T is especially suitable for use in or on an oil burner and is designed to operate spill back triplet atomisers with integrated shut-off needles. The strong spring on the actuating rod pushes the needles in closed position. This ensures a reliable shut-off under all circumstances.

Compressed air actuates the piston for opening, either controlled by two external solenoid valves (see 00-Y101-8H-E) or by one 3/2 solenoid valve (see 00-Y101-8G-E). The piston has a fixed travel. While opening, each needle inside the atomiser is retracted in the correct position by means of the spring inside the atomiser, against a fixed stop on the needles itself.

During the pre-purge period of the burner, the needles are keeping the orifices closed and the fuel circulates through the lance at pre-set supply and return pressure. On energising both solenoid valves or the 3/2 solenoid valve, even after long idle intervals, there is immediate atomisation guaranteeing perfect ignition.

The burnerlance is suitable for supply pressures from 20 up to 40 bar and fuel temperatures up to 140°C.

Mounting the atomiser

Often a lance is delivered with the atomiser mounted. This is just to avoid loss during transportation. The atomiser then has been screwed on by hand, not tightened. In this case, you should also mount the atomiser as described below.

The atomiser is to be build in according to information sheet 32-W101-6A-E. To ensure adequate sealing, the sealing surfaces at the adaptor and at the atomiser should not be damaged. Never use any additional sealant on these surfaces.

Remove the capnut from the lance. Make sure all parts involved are clean and free from any dust or other particles. Place the atomiser, in the correct direction, inside the capnut as shown in sheet 32-W101-6A-E.

It is advised to apply a little “Molykote HSC” or equivalent compound, on the thread of the adaptor only, to prevent problems when dismounting the capnut after a longer period. The sealing surface of the adaptor, inside of the lance and all parts of the atomiser are to be kept absolutely clean.

Now take the capnut including the atomiser and insert the triangle at the back of the atomiser inside the adaptor. The threads in the capnut and on the adaptor will not meet yet. One has to compress the spring inside the atomiser by pushing. While screwing on the capnut, after a few turns, the resistance increases. This is the force of the spring inside the lance building up. Screw on the nut by hand as tight as possible. Tighten the capnut firmly with a spanner. The adaptor has flat sides to hold the lance while screwing or unscrewing the capnut. These flats exclusively serve this one purpose!
Connections

The connections (see 00-Y101-8G-E and 00-Y101-8H-E) on the block of the lance are marked as follows:

S  Fuel supply to the atomiser. The pressure only depends on the desired behaviour for the atomiser.
R  Fuel return from the atomiser. Fuel output control is achieved by connecting either a pressure or a volume regulator.
C  Compressed air supply and return for needle actuation. A filter having meshes smaller than 50 µm should be present. The needles open correctly at a pressure between 5 and 15 bar. The returning air should be allowed to flow freely without counterpressure. Only then reliable closing of the needles is possible.

To prevent malfunction, be careful when removing the plastic plugs from the connection ports and make sure no material stays behind.

When choosing fittings, make sure that the channels inside the connection block remain fully open. Even a partial blockage at one of the channels inside will inevitably lead to malfunctioning of the burnerlance.

Never use any additional sealant on the thread. The remains getting inside the lance could lead to failures. There are no objections against the use of flat gasket rings to seal the fittings.

Function

During the pre-purge period, both the external solenoid valve in the supply line and the external volume or pressure regulator are open. The solenoid valves operating the needles are currentless. Thus, the spring loaded actuating rod pushes the needles against the seats of the orifices up front, keeping them closed, preventing fuel from reaching the furnace prematurely. The pressure at port "C" is 0 bar. The fuel circulates from port "S" via the swirlers in the atomiser through the lance toward port "R", bringing the whole up to operating temperature.

Before opening the needles, make sure the IGNITION IS TURNED ON. In addition, the external regulator and the combustion airflow are to be adjusted beforehand in such a way that the burner will START ON LOW FLAME.

As soon as one switches on the solenoid valves operating the needles, the pressure at port "C" increases to 5 bar or more; the rod retracts, the needles open and the ignition causes a flame immediately.

An external volume or pressure regulator in the return line controls the output flow of the atomiser.

 Interruption of the power supply to the solenoid valve at port "C" leads to immediate closing of the needles, handled by the spring inside the lance. The fuel flow from the atomiser stops abruptly. The pressure at port "C" drops to 0 bar. The fuel circulation from port "S" via the swirlers toward port "R" continues as before, maintaining the temperature of the lance.

If firing heavy fuel, we advise mounting a heating device to preheat the lance for those applications where the fuel supply to port "S" often stops during longer intervals. Normally it is sufficient to apply an electrical heating plate just to preheat the connection block at the lance. Four threaded bores in the connection block allow mounting such a heating plate. This heater could work permanently, but it should at least be switched on in time before fuel is supplied to port "S" to achieve correct operation of the control system inside the lance.
Maintenance

The burnerlance normally does not require any maintenance. Wear or damage of the orifices, the swirlers and the needles highly depend on fuel quality. The complete atomiser is easy to exchange. The only moving part inside the lance is the actuating rod with the piston. After a while some wear may occur on the o-rings. Complete seal sets are available for replacement.

Before taking one of the following steps, remove the atomiser from the lance and put the capnut back on as protection for the adaptor. Always pay attention not to damage the sealing surfaces at the adaptor and the atomiser. Before re-assembly, make sure all parts involved are undamaged and perfectly clean.

To exchange the o-ring 25,12x1,78 on the piston, remove the cover, held by 4 screws. Pull out the bearing together with the o-ring 33,00x2,62. Exchange the o-ring 25,12x1,78 and put the bearing with o-ring back in place. Now we can mount the cover.

To exchange the inner o-rings 6,02x2,62, remove the cover, held by 4 screws. Pull out the bearing together with the o-ring 33,00x2,62. Use a piece of wood or plastic to push back the finger. WARNING FOR INJURY: The actuating rod comes out suddenly. After that, you can pull it out easily.

The actuating rod has to be taken apart to exchange the o-rings 6,02x2,62. Remove the pin that connects the holder to the rod and take the holder off. The rod in lances longer than 800 mm is – for extra guidance – provided with triangles. Each triangle is secured with a pin. Remove these pins and triangles. Clamp the free end of the rod in a bench vice with soft yaws placing the stop against the yaws. Remove the pin holding the stop and release the spring pressure by slowly opening the vice. Take off the stop, the spring, the spring disc, the disc and the between disc. Polish any sharp edges on the rod and exchange the o-rings 6,02x2,62. Near the o-rings, the rod should be absolutely free of damages. Re-assemble the actuating rod in reverse order.

To test, put the actuating rod into the burnerlance without the o-ring 25,12x1,78 and without the o-rings 18,72x2,62 on the discs. The rod should move freely. Pull it back, mount both o-rings 18,72x2,62 on the discs and push the rod in place. Slide the bearing over the piston in the connection block and turn it to check the fit. If fitting correctly, mount the o-ring 25,12x1,78 on the piston and push the bearing with the o-ring 33,00x2,62 back in place. Now we can mount the cover.

Finally, mount the orifice and the swirler as described under "Mounting the atomiser".
